GROWING BETTER
OATS

GROWING BETTER OATS

Pre-Planting Decisions

- Rotate crops and do not follow other cereal grains.
- Select disease-resistant varieties (esp. for crown rust & BYDV).
- 100 bu/A oats requires 73 lbs of available N, 27 lbs of P205, 18 lbs of K20, and 7 lbs of sulfur. *Too much N increases lodging and disease while delaying maturity.*
- Check the rotational restrictions on last year's herbicides.
alseed.com/oat-herbicide

Planting Tips

- Use clean, certified seed with a good germination test.
- Avoid fields with weed problems, especially wild oats, thistle, and volunteer wheat.
- Plant early to maximize yields & test weight, and for better weed control. *(Mid-March for Iowa, mid-April north)*
- Plant 80 - 110 lbs (~3 bushels) per acre, 1" - 1½" deep. Reduce to 1½ - 2½ bushels if underseeding with alfalfa.
- Plant in narrow rows of 6" - 7" to outcompete weeds.

Management & Harvest

- Consider herbicides for foxtail & broadleaves during lag phase of growth (weeds less than 2"). Fungicide may also be needed.
- Swath when least mature kernels change from green to cream and panicle has turned yellow.
