TEST COMMENTS:

The seedbed was perfect at planting. A hail event at the V4 stage resulted in an estimated 24% loss. Huge rains in the area at R1 had little effect at this site, other than full soil saturation (fields flooded on farms to the west of this site). Myron reports 25" of rain in the growing season, which closely matches the weather calculation on page 2 of this report. This conventional Food Grade Soybean Harvest Report shows an estimated premium price of \$3.50 over the December 2025 price. Please ask questions about the actual variety premiums before you plant.
